d PIR:FGHUGB).

C:Comment: Plasmin is inactivated by alpha-2-antiplasmin (see PIR:ITHUA2) immediately C:Comment: Plasmin is formed by alpha-2-antiplasmin (see PIR:ITHUA2) immediately rg-580, resulting in two chains connected by two disulfide bonds. Without the inhibit C:Comment: Microplasmin is formed by autolytic cleavage of plasmin under artificial c C:Comment: Stromelysin 1 (see PIR:KCHUS1) acts on plasminogen to produce angiostatin.

In the presence of the inhibitor, the activation involves also removal of the activation peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A;Residues: 1-812 <DEG>

A, Description: stimulates mitosis of hepatocytes and other cells
A, Note: does not have proteinase activity
C; Superfamily: hepatocyte growth factor; kringle homology; trypsin homology
C; Keywords: duplication; glycoprotein; growth factor; heterodimer; kringle
F; 42-477,478-709/product: hepatocyte growth factor #status predicted <ACH>

Title:
Perfect score:
Sequence: US-09-657-431-5 75 1 RNPDGDVGGPWK 12

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched:

105224 seqs, 38719550 residues

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

BIOL. Chem. 264:5957-5965(1989).

J. BIOL. Chem. 264:5957-5965(1989).

FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE UROKINASE—TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND WON WILLEBRAND FACTOR.

LAMININ AND VON WILLEBRAND FACTOR.

LAMININ AND VON WILLEBRAND FACTOR.

FIBRIN. ACTIVATED WITH CATALYTIC AMOUNTS OF STREPTOKINASE.

FIBRIN. ACTIVATED WITH CATALYTIC AMOUNTS OF STREPTOKINASE.

FIBRIN. ACTIVATED WITH CATALYTIC AMOUNTS OF STREPTOKINASE.

FIBRIN. ACTIVATED WITH CATALYTIC AMOUNTS OF THE INHIBITOR, THE ACTIVATION INVOLVES ONLY CLEAVAGE AFTER ARG-580, RESULTING IN Z CHAINS HELD TOGETHER BY 2 DISULFIDE BONDS. WITHOUT THE INHIBITOR, THE ACTIVATION INVOLVES ONLY CLEAVAGE AFTER ARG-580, RESULTING IN Z CHAINS HELD TOGETHER BY 2 DISULFIDE BONDS. WITHOUT THE INHIBITOR, THE ACTIVATION INVOLVES ALSO REMOVAL OF THE ACTIVATION PEPTIDE.

FINILARITY: BELONGS TO PEPTIDASE FAMILY. S1; ALSO KNOWN AS THE TRYESIN FAMILY. PLASMINGEN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 J. ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIBRIN. ACTIVATED WITH CATALYTIC AMOUNTS OF STREPTOKINASE.
MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TEIN SEG. Data Anal. 4:69-74(1991).

FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT MEAKENS THE WALLS OF THE GRAFIAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS
TRYPSIN FAMILY. PLASMINOGEN SUBFAMILY.

AS Schaller J., Straub C., Kampfer U., Rickli E.E.,;

AT "Complete amino acid sequence of ovine miniplasminogen.";

AT Protein Seq. Data Anal. 5:21-25(1992).

C -!- FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROTECLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION,

AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAFIAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN GRAAFIAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN AS CI AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND C.5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN,

C -I- ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN AND TO PLASMIN BY PLASMINOGEN AND TO PLASMIN BEING BOUND TO FIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

-I- MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

MISCELLANBOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

MISCELLANBOUS: IN THE PRESENCE OF THE INHIBITOR, THE ACTIVATION
INVOLVES ONLY CLEAVAGE AFTER ARG-581, RESULTING IN 2 CHAINS HELD
TOGETHER BY 2 DISULFIDE BONDS. WITHOUT THE INHIBITOR, THE
ACTIVATION INVOLVES ALSO REMOVAL OF THE ACTIVATION PEPTIDE.

SIMILARITY: CONTAINS 5 KRINGLE DOMAINS.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
TENDERN TAKENTY OF THE MALTER ACTIVATION AND THE
TENDERN TAKENTY OF THE MALTER ACTIVATION AS THE
TENDERN TAKENT OF THE MALTER ACTIVATION AS THE
THEORY OF THE MALTER ACTIVATION AS THE MALTER ACTIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.

SIMILARITY: CONTAINS 38 KRINGLE DOMAINS.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             naturally occuring proteolytic fragments is correlated with atherosclerosis. Homology with plasminogen kringles IV and V is thought to underlie the atherogenicity of the protein, because the fragments are competing with plasminogen for fibrin(ogen) binding. MISCELLANEOUS: Apo(a) is known to be proteolytically cleaved, leading to the formation of the so called mini-Ip(a). Apo(a) fragments accumulate in atherosclerotic lesions, where they may promote thrombogenesis. O-glycosylation may limit the extent of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTM: N- and O-glycosylated. The N-glycans are complex blantennary structures present in either a mono- or disialylated state. The O-glycans are mostly (80%) represented by the monosialylated core type I structure, NeuNAcalpha2-3Galbeta1-3GalNAc, with smaller amounts of disialylated and non-sialylated O-glycans also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Apo(a) is the main constituent of lipoprotein(a) (Lp(a)). It has serine proteinase activity and is able of autoproteolysis. Inhibits tissue-type plasminogen activator Lp(a) may be a ligand for megalin/Gp 330.

SUBUNIT: Disulfide-linked to apo-B100. Binds to fibronectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TRYPSIN FAMILY. PLASMINOGEN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DISEASE: Elevated plasma concentrations of apo(a) and its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              detected

IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.

LAMININ AND VON WILLEBRAND FACTOR.

ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO FIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

SIMILARITY: CONTAINS 5 KRINGLE DOMAINS.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY. PLASMINOGEN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PF00024; PAN; 1.

Biophys. Acta 1216:299-303(1993).

FUNCTION: HGF IS A POTENT MITOGEN FOR MATURE PARENCHYMAL HEPATOCYTE CELLS, SEEMS TO BE AN HEPATOCYTOPHIC FACTOR, AND ACTS AS GROWTH FACTOR FOR A HOAD SPECTRUM OF TISSUES AND CELL TYPES. IT HAS NO DETECTABLE PROTEASE ACTIVITY.

SUBUNIT: DIMER OF AN ALPHA CHAIN AND A BETA CHAIN LINKED BY A

CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity CC in vivo for the treatment of various disorders. Endogenous therapeutic CC in vivo for the treatment of various disorders they require frequent CC administration due to rapid degradation by peptidases in the body. CC Modifying and attaching therapeutic peptides to albumin prevents or CC reduces the action of peptidases to increase length of activity (half contrace) and specificity as bonding to large molecules decreases contrace intrace and interference with phonographs of activity in the process of intrace).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a modified anti-angiogenic peptide (I) CC comprising a reactive group that reacts with amino groups, hydroxyl CC groups or thiol groups on blood components to form stable covalent co bonds. The reactive group is selected from succinimidyl or maleimido GC groups. (I) can have anti-inflammatory, vasotropic, cytostatic, antirheumatic, antipsoriatic, antidiabetic, antiarteriosclerotic and CC extending the in vivo half-life of a kringle 5 peptide in a patient to provide an anti-angiogenesis in a human, where the derivative is reacted CC extending the in vivo half-life of a kringle 5 peptide in a patient to peptide can be used for treating inflammatory disorders (e.g. immune and CC experience associated with inappropriate or inopportune invasion of CC capillary proliferation in atherosclerotic plaques or osteoporosis, or metastases, angiofibromas, retrolental fibroplasia, haemangiomas, cCC casposi's sarcoma or other cancers requiring neovascular sation to support tumour growth). The peptides are useful for treating these CC diseases in mammalian or human pattents. AAB36567 represents a mammalian CC claimed kringle 5 peptides from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
